Courses at the Department of Solid Mechanics. The department offers basic undergraduate courses for the Mechanical, Design and Product Development, Vehicle, Engineering Physics and Material Design programmes (SE1010, SE1055 and SE1020). The basic course SE1020 is also elective for all programmes. The course SE1025 FEM for Engineering Application continues the topic and is a prerequisite for specialisation within the Solid Mechanics track.

Acknowledgements The master's thesis presented in this paper has been carried out in partial fulfilment of the degree Master of Science in Mechanical Engineering at Lund Institute of Technology. The work has been carried out at STFI-Packforsk in Stockholm, Sweden during the autumn of 2005, with supervision from the Division of Solid Mechanics at Lund Institute of Tech-nology.

vibration and their active control, as well as machine elements and design optimization. The research rests on theoretical, numerical and experimental investigations of phenomena that are most often highly cross disciplinary and spans many length scales, from the sub-micron range of material micro structures to the structural scale.

Solid Mechanics is a classic engineering science discipline, ranging from basic to applied science. The topic can be regarded as a link between materials science and applied mechanics with emphasis on the latter. Solid Mechanics deals with the mechanical properties of materials and structures. The research at the department is focused on computational methods, fracture mechanics, composite mechanics, contact mechanics, mechanics of materials, paper

You will be introduced to mathematical modelling of engineering designs, standard machines, and mechanisms using 2D and 3D diagrams. The course begins with statics, which is the science of forces. By the end of the course you will be able to: write down equilibrium conditions of structural elements and units of machines and mechanisms.

Research and teaching in the Mechanics area are focused on enriching the spectrum of models and tools for describing and predicting static and dynamic thermomechanical phenomena. Understanding and optimizing the mechanical and dynamical response of a material system is essential to its ultimate application. Research Includes: Fluid mechanics, solid mechanics, nonlinear mechanics, computational mechanics, and structural mechanics.
