EN 285 - European Standards

EN 285 is required for companies and organizations that are currently exporting or plan to export sterile products to the European Union (EU). Though developed in Britain, these guidelines govern sterilization requirements across the EU, specifically related to the quality of the steam being utilized in the steam sterilization of critical equipment and pharmaceutical drugs.

Antisepsis, Disinfection, and Sterilization: Types, Action, and Resistance, by Gerald E. McDonnell, is a detailed and accessible presentation of the current methods of microbial control. Each major category, such as physical disinfection methods, is given a chapter,

in which theory, spectrum of activity, advantages, disadvantages, and modes of action of the methods are thoroughly and clearly presented. Sufficient background on the life cycles and general anatomy of microorganisms is provided so that the reader who is new to microbiology will better appreciate how physical and chemical biocides work their magic on microbes. Other topics in the book include: Evaluating the efficacy of chemical antiseptics and disinfectants, and of physical methods of microbial control and sterilization. Understanding how to choose the proper biocidal product and process for specific applications. Classic physical and chemical disinfection methods, such as heat, cold, non-ionizing radiation, acids, oxidizing agents, and metals. Newer chemical disinfectants, including, isothiazolones, micro- and nano-particles, and bacteriophages as control agents. Antisepsis of skin and wounds and the biocides that can be used as antiseptics. Classic methods of physical sterilization, such as, moist heat and dry heat sterilization, ionizing radiation, and filtration, along with newer methods, including, the use of plasma or pulsed light. Chemical sterilization methods that use ethylene oxide, formaldehyde, or a variety of other oxidizing agents. A detailed look at the modes of action of biocides in controlling microbial growth and disrupting microbial physiology. Mechanisms that microorganisms use to resist the effects of biocides. The second

edition of Antisepsis, Disinfection, and Sterilization: Types, Action, and Resistance is well suited as a textbook and is outstanding as a reference book for facilities managers and application engineers in manufacturing plants, hospitals, and food production facilities. It is also essential for public health officials, healthcare professionals, and infection control practitioners.

Decontamination in Hospitals and Healthcare brings an understanding of decontamination practices and the development of technologies for cleaning and control of infection to a wide audience interested in public health, including healthcare specialists, scientists, students or patients. Part one highlights the importance and history of decontamination in hospitals and healthcare before exploring the role of standards in decontamination, infection control in Europe, and future trends in the area. Part two focuses on decontamination practices in hospitals and healthcare. It considers the role of the nurse in decontamination, the issues of microbial biofilm in waterlines, control of waterborne microorganisms, and the use of gaseous decontamination technologies. Further chapters explore decontamination of prions, the use of protective clothing, no-touch automated room disinfection systems, and controlling the presence of microorganisms in hospitals. Part three discusses practices for

decontamination and sterilization of surgical instruments and endoscopes. These chapters examine a range of guidance documents, including the choice framework for local policy and procedures for decontamination of surgical instruments, as well as novel technologies for cleaning and detection of contamination. Decontamination in Hospitals and Healthcare provides a reference source on decontamination for public health professionals and students concerned with healthcare. It is particularly useful for scientists in microbiology and disinfection/decontamination laboratories, healthcare workers who use disinfectants, students in microbiology, clinicians, members of the Institute of Decontamination Sciences/Central Sterilising Club, and those employed in the Central Sterile Services departments of healthcare facilities. Discusses decontamination processes in Europe Provides an in-depth understanding into decontamination in healthcare settings, specifically hospitals and dental practices Examines the decontamination of surgical equipment and endoscopes

Hospital infection is one of the major causes of morbidity and mortality following any procedure on the human body in the hospital. Infection arises primarily because of lack of knowledge by the hospital staff about sterilization. Today, majority of super-specialty

hospitals import very expensive sterilizing equipment. However, very little effort is made to train the people who run these machines. We must understand that the machine is as clever or as dumb as the person behind it. Unfortunately, in spite of so many advances in health care and so many advances in medical education, many countries do not have a single recognized training program to train sterilization technicians. This is our effort in that direction to come up with a formal training program to train technicians in this vital area of health care delivery system. This book shall benefit technologists and Central Sterile Supplies Department (CSSD) staff as well as medical students and hospital administrators to understand the intricacies and workings of a successful CSSD unit and contribute to hospital infection control in a large way.

This Second Edition is a comprehensive resource on sterilization and disinfection of reusable instruments and medical devices

The new edition of this established and highly respected text is THE definitive reference in its field. It details methods for the elimination or prevention/control of microbial growth, and features: New chapters on bioterrorism and community healthcare New chapters on microbicide regulations in the EU, USA and Canada Latest material on

microbial resistance to microbicides Updated material on new and emerging technologies, focusing on special problems in hospitals, dentistry and pharmaceutical practice Practical advice on problems of disinfection and antiseptics in healthcare A systematic review of sterilization methods, with uses and advantages outlined for each Evaluation of disinfectants and their mechanisms of action with respect to current regulations The differences between European and North American regulations are highlighted throughout, making this a truly global work, ideal for worldwide healthcare professionals working in infectious diseases and infection control.
