This report contains a range of gender statistics which examine the relative positions of men and women in Europe in terms of income, influence and social roles at three stages of life, youth, adulthood and in retirement, as well as marking developments over time. It looks at education and household trends in childhood and at the age at which young adults leave the family home. It goes on to examine inequalities in working life, caring activities, participation in decision-making in politics and the economic sector, as well as the state of health for women and men. The final section reviews relative gender positions beyond retirement age, including income, health status and social relations, life expectancy and whether or not they are still working.

This self-contained volume explains perturbation techniques by means of solved problems. Ideal for self-study, it provides 360 solved problems and an almost equal number of supplementary problems.

This engaging introduction to random processes provides students with the critical tools needed to design and evaluate engineering systems that must operate reliably in uncertain environments. A brief review of probability theory and real analysis of deterministic functions sets the stage for understanding random processes, whilst the underlying measure theoretic notions are explained in an intuitive, straightforward style. Students will learn to manage the complexity of randomness through the use of simple classes of random processes, statistical means and correlations, asymptotic analysis, sampling, and effective algorithms. Key topics covered include: • Calculus of random processes in linear systems • Kalman and Wiener filtering • Hidden Markov models for statistical inference • The estimation maximization (EM) algorithm • An introduction to martingales and concentration inequalities. Understanding of the key concepts is reinforced through over 100 worked examples and 300 thoroughly tested homework problems (half of which are solved in detail at the end of the book).
