Impact of Tectonic Activity on Ancient Civilizations: Recurrent Shakeups, Tenacity, Resilience, and Change observes a remarkable spatial correspondence of zones of active tectonism (i.e. plate boundaries in the earth ' s crust) with the most complex cultures of antiquity ( " great ancient civilizations " ), and continues to explore the meaning of this relationship from a number of independent angles. Due to resulting site damage, this distribution is counter-intuitive. Nevertheless, systematic differences between " tectonic " and " quiescent " cultures show that tectonic activity corresponded in antiquity with more cultural dynamism. Data of several independent types support direct cultural influence of tectonism, including vignettes of the impact of tectonism in specific ancient cultures. An expectation of change seems to be a feature such tectonic cultures shared, and led to an acceleration of development. These dynamics continue though much obscured in the present day.

Over 250,000 people were killed in the Tangshan, China earthquake of 1976, and other less active tectonic processes can disrupt river channels or have a grave impact on repositories of radioactive wastes. Since tectonic processes can be critical to many human activities, the Geophysics Study Committee Panel on Active Tectonics has presented an evaluation of the current state of knowledge about tectonic events, which include not only earthquakes but volcanic eruptions and similar events. This book addresses three main topics: the tectonic processes and their rates, methods of identifying and evaluating active tectonics, and the effects of active tectonics on society.

This text includes examiners' tips on preparing for and sitting the exam and explains how case studies should be used. It also contains double-page spreads, which contain key information for revising each area of subject content.

Evidence is presented that indicates that Monterey Submarine Canyon was once the terminus of a major land drainage system. This pre-existing drainage system is not in evidence today because it has been altered by displacement along the San Andreas Fault. A numerical model based on conservation of mass and plate tectonic reconstruction is utilized to reconstruct the topography of the region as it appeared prior to onset of motion along the San Andreas Fault. Model results indicate that the Colorado River may have drained into Monterey Bay during early Miocene time. (Author).
