Laparoscopic colectomy is a type of minimally invasive surgery. Laparoscopic colectomy, also called minimally invasive colectomy, involves several small incisions in your abdomen. Instead of a big incision, the surgeon makes a few small cuts (0.5-1 centimeters) in the abdominal cavity to insert a surgical camera and instruments and perform the operation.

Laparoscopic colorectal surgery. Laparoscopic colorectal surgery avoids the need for a long incision (cut) in the abdomen (tummy) and so there is significantly less pain after the operation from the wound. It also means that you stay in hospital a shorter time (a matter of days) and can return to normal activities in a few weeks.

Abstract Background: Laparoscopic resection is increasingly used in colorectal cancer (CRC). It has been suggested to carry short-term benefits in safety, recovery, and preservation on immune function for patients with CRC. However, the impact of laparoscopic resection on natural killer (NK) cells is largely unclear.
