Minimally invasive endodontics (MIE) is a concept of maximum preserve the healthy coronal, cervical and radicular tooth structure during the endodontic treatment. For success, the dentist must aware between conservation and elimination of tooth structure during endodontic procedure to fulfill the endodontic goals.

Minimally Invasive Endodontics—a Promising Future Concept—

Contemporary research efforts are currently directed to better understanding dentin behavior and structure during aging and function. An alternative approach is to minimize structural changes during root canal therapy, which may result in a new strategy that can be labeled minimally invasive endodontics (MIE).

Minimally Invasive Endodontics—a Promising Future Concept—

With advancement in research new insights in pulp biology have developed overtime, a clinical research on vital pulp therapy now provides options for enveloping new biologically driven treatment protocols. Minimally invasive endodontics treatment modalities include two major rewards: firstly, preservation and maintaining physiological and defensive functions; secondly, lesser removal of hard tissue

Minimally Invasive Endodontics: A Promising Future Concept

Minimally invasive access to the root canal system is described, and detailed attention is devoted to the application of novel strategies in root canal instrumentation and disinfection, root canal filling, coronal restoration, retreatment, and endodontic surgery. Minimally invasive alternatives to complete endodontic treatment, such as vital pulp therapies, and to dental extraction and implant placement, including surgical extrusion, intentional replantation, and tooth autotransplantation ...

Minimally invasive alternatives to complete endodontic treatment, such as vital ...

Minimally Invasive Approaches in Endodontic Practice—

Minimally Invasive Endodontic Treatment (MIE) Minimally invasive endodontic (MIE) treatment requires attention to diagnostic details and procedures that not only treat diseased tissue but also preserve the maximum amount of healthy tooth structure to best support restoration of the tooth with a crown or filling material.

Minimally Invasive Endodontics—Treatment—Evolution—

tooth is the principle of minimal invasive dentistry. Minimal invasive endodontics (MIE) aims at salvag ing the tooth structure during the endodontic treatment and its post endodontic restoration...

(PDF) Minimal Invasive Endodontics: The New Revolution

Recapitulating Endolight, the minimal invasive endodontic approach, can benefit dental health care in several ways: maintaining the viability of the pulp as long as possible to induce a biological response to prevent apical periodontitis and improving the success rate of vital pulp treatment.

Minimally Invasive Endodontics—a new diagnostic system—

Minimally invasive cavity access is an alternative approach to traditional endodontic treatment [6, 7], which emphasizes a greater preservation of healthy dental tissue during the cavity opening ...

(PDF) Minimally Invasive Endodontics: Challenging—

More advanced treatment options in endodontics (for example magnification and more flexible NiTi instrumentation) has therefore also shifted paradigms to a minimal invasive approach in both access cavity preparation as well as shaping of root canals in order to preserve dentine (Gluskin, Peters and Peters, 2014).

Minimally Invasive Endodontics—Using a New Single File—

For endodontics, the question might be whether current therapeutic methods are minimally invasive enough, or whether a more minimally invasive approach is needed. Minimally invasive endodontics (MIE) refers to the minimal removal of dentin during the three phases of a root canal procedure: (1) the coronal access preparation; (2) the radicular apical preparation; and (3) the flaring of the canal that connects the coronal to the apical preparations.

Minimally Invasive Endodontics: Finding the Right Balance—

MIE aims to preserve the maximum of tooth structure during root canal therapy, and the concept covers the whole process of diagnosis and treatment of teeth. This review article focuses on describing the minimally invasive concepts and operating essentials in endodontics, from diagnosis and treatment planning to the access opening, pulp cavity finishing, root canal cleaning and shaping, 3-dimensional root canal filling and restoration after root canal treatment.

[Theory and practice of minimally invasive endodontics]

Objective: This study was to evaluate the potential of Erbium:Yttrium Aluminum Garnet laser-activated sodium hypochlorite irrigation (Er:YAG + NaOCl) for minimally invasive endodontics (MIE). Background data: Er:YAG laser irradiation can dramatically enhance the penetration of NaOCl which may be a promising protocol for MIE. Methods: Extracted human teeth were contaminated with Enterococcus ...
