Ocular Treatment: Evidence Based eBook: Roy Frederick...

Diabetic retinopathy (DR) is the most frequent microvascular complication from diabetes and requires annual screening and at least annual follow-up. A systemic approach to optimize blood glucose and blood pressure may halt progression to severe stages of DR and obviate the need for ocular treatment. Although there is evidence of benefit from fenofibrate or intravitreous anti-VEGF treatment for eyes with nonproliferative DR (NPDR), these therapies are not standard care for NPDR at this time.

Evidence-Based Treatment of Diabetic Retinopathy

Damage to the ciliary body epithelium results in decreased secretion of ascorbate and a reduction in anterior chamber concentration Ascorbate is required by corneal keratocytes to synthesize collagen and repair stroma In a 1980 article published in Ophthalmology, authors found that severe ocular alkali burns in rabbits results in a decrease in aqueous humor ascorbate levels to 1/3 normal levels and that this deficiency can be reversed by immediate treatment with parenteral or topical ascorbate.
