By James Merlino, MD. Communication is the cornerstone of healthcare. Effective communication is not only critical to meeting patient needs and providing safe, high-quality, and patient-centered care, it is necessary to how we manage healthcare delivery. To facilitate meaningful improvement, the road to healthcare transformation must be paved with good communication—vertically from the top down and the bottom up, and horizontally across the continuum of care delivery.

Racial and ethnic disparities in health care are known to reflect access to care and other issues that arise from differing socioeconomic conditions. There is, however, increasing evidence that even after such differences are accounted for, race and ethnicity remain significant predictors of the quality of health care received. In Unequal Treatment, a panel of experts documents this evidence and explores how persons of color experience the health care environment. The book examines how disparities in treatment may arise in health care systems and looks at aspects of the clinical encounter that may contribute to such disparities. Patients' and providers' attitudes, expectations, and behavior are analyzed. How to intervene? Unequal Treatment offers recommendations for improvements in medical care financing, allocation of care, availability of language translation, community-based care, and other arenas. The committee highlights the potential of cross-cultural education to improve provider-patient communication and offers a detailed look at how to integrate cross-cultural learning within the health professions. The book concludes with recommendations for data collection and research initiatives. Unequal Treatment will be vitally important to health care policymakers, administrators, providers, educators, and students as well as advocates for people of color.

This book offers a much-needed introduction to the dynamics of the communication exchange between providers and patients in the health-care environment, explaining how health communication theory and research can help us better understand these complex interactions, and provide strategies for improving patient and provider communication.

The Inpatient Functional Communication Interview: Screening, Assessment, and Intervention (IFCI: SAI) is a set of four resources for speech-language pathologists (SLPs) and other healthcare professionals working in acute and rehabilitation hospitals. They can be used separately or together to enhance patient-provider communication in hospitals. The IFCI: SAI has been developed so healthcare professionals can identify and support patients who have difficulty communicating, with a focus on patients with communication disability. The following resources are included: *Screening Questionnaire. Designed to identify patients who have difficulty communicating about their healthcare and will need support to communicate with healthcare providers in hospital. *Inpatient Functional Communication Interview (IFCI). A semi-structured interview that the SLP conducts at the patient's bedside. During the interview, the SLP investigates how well the patient can communicate in everyday healthcare communication activities. If the SLP and patient have difficulty communicating, the clinician investigates if any communication supports or strategies enable successful communication. *Impairment Rating Scales. These assist the SLP to rate their initial clinical impressions of the patient's speech intelligibility, spoken language, and cognitive-communicative function. Each rating scale provides descriptions of speech, language, and cognitive-communicative function on a five-point scale ranging from no impairment to complete impairment. *Environmental Questionnaires (EQs). The set of EQs assist SLPs and other healthcare professionals to screen the communicative environment for factors influencing patient-provider communication in their setting. Once the factors that influence patient-provider communication have been identified, SLPs and other healthcare professionals may be better informed and more able to systematically address these factors to develop communicatively accessible hospital services.

Type 1 diabetes (T1D) is one of the most common pediatric chronic illnesses. Glycemic control among patients with T1D often deteriorates during adolescence; yet little is known about the most effective way for providers to communicate with adolescents to prevent this decline. Given the importance of effective communication, examination of effective patient-provider communication strategies is needed. The current investigation used Motivational Interviewing (MI) as a framework to help characterize naturally-occurring adolescent patient-provider communication in medical encounters and examined the relations between provider communication and T1D self-management and control. Participants were five pediatric endocrine providers and 55 adolescents with T1D (49% female; 76% White; M age= 14.8 years, SD= 1.6). Mean T1D duration was 7.9 years (SD= 3.9) and mean baseline HbA1c was 8.58% (SD= 1.4). Adolescents and caregivers completed surveys related to diabetes self-management and psychosocial functioning at a routine endocrinology visit and again at one and three months post-baseline. Medical encounters were audio-recorded and coded. HbA1c was obtained via medical chart review at baseline, three, and six month appointments. Hierarchical multiple regressions revealed that, after controlling for prior MI training (providers) and adolescent baseline HbA1c, age, and race, use of MI non-adherent behavior (e.g., confronting, persuading) was associated with 1) poorer three month HbA1c, F(5,45)= 11.19, p

Patient-provider communication is an important realm in health communication because it is an important predictor of health care outcomes and patient satisfaction. When examining patient-provider communication, culture should be taken into consideration, especially if patients and providers are from different cultures. As more and more immigrants come to the U.S. and they commonly experience anxiety and uncertainty because of cultural and structural barriers, optimizing patient-provider communication process to improve the cross-cultural health communication quality is crucial and necessary. Anxiety/Uncertainty Management (AUM) Theory explains how people achieve communication effectiveness when they are involved in intercultural encounters.
