Solutions to Stock Valuation Practice Problems

1.  $D_5 = D_0 (1 + g)^5 = \$1.5 (1 + 0.03)^5 = \$1.5 \times 1.15927 = \$1.73891$

2.  $P_0 = \frac{D_0 (1 + g)}{(r_e - g)} = \frac{\$1 (1 + g)}{0.10 - g}$

$\$25 = \frac{\$1 + g}{0.10 - g}$

$\$25 (0.10 - g) = \$1 + g$

$\$2.5 - 25g = \$1 + g$

$\$1.5 = 26g$

$g = 5.7692\%$

3. Stock Current year's dividend Expected growth in dividends Required rate of return Value of a share

## ~~Stock Valuation Practice Problems~~

Presumably, the current stock value reflects the risk, timing and magnitude of all future cash flows, both short-term and long-term. If this is correct,

# Read Book Stock Valuation Problems And Solutions

then the statement is false. Solutions to Questions and Problems 1. The constant dividend growth model is:  $P_t = D_t \times (1 + g) / (R - g)$  So the price of the stock today is:  $P_0 = D_0 (1 + g) / (R - g)$

Stock valuation is the process of determining the intrinsic value of a share of common stock of a company. There are two approaches to value a share of common stock: (a) absolute valuation i.e. the discounted cashflow method and (b) relative valuation (also called the comparables approach).. The purpose of stock valuation is to find the value of a common share which is justified by the company ...

## ~~Stock Valuation | Methods & Formulas~~

Stock valuation based on the dividend discount model typically takes one of three

# Read Book Stock Valuation Problems And Solutions

forms depending on what pattern we expect the dividends to follow. These three model variations are (1) the no-growth case, (2) the constant-growth case, and (3) the non-constant-growth (or supernormal-growth) case.
