Study Guide: Electricity, Magnetism & Circuits

The electric field set up in a wire connected to the battery terminals causes the current to flow, which occurs when the current has a complete conducting path from one terminal of the batter to the other—called a circuit. By convention, the direction of current in the external circuit (not in the battery) is the direction of motion of positive charges.

Ohm's law yields $V_c = IX_c$, where V_c is the rms voltage across the capacitor and I is the rms current in the circuit. Consider a circuit with only an inductor and an ac generator. Figure shows the plots of the current and voltage as a function of time for the inductor. Note again that the voltage and current are not in phase.

and short circuit loads) if they have the same voltage and current relationships across the terminals. Finding the Thévenin or Norton equivalent requires calculating the following variables: $V_T = V_{OC}$, $I_N = I_{SC}$, and $R_T = R_N = V_{OC} / I_{SC}$ (where T stands for Thévenin, OC stands for an open-circuit load, N stands for Norton, and SC stands for a short circuit load).

need to understand how current flows through a circuit. Current flows from a high voltage to a lower voltage in a circuit. Some amount of current will flow through every path it can take to get to the point of lowest voltage (usually called ground). Using the above circuit as an example, here's how current
