Surface impedance boundary conditions can be developed in a number of ways. The best known surface impedance is due to Leontovich whose surface impedance is no more than the wave impedance in the conductor [2,3] and since that is based on plane wave representation it is suitable for flat or locally flat surfaces.

The Dirichlet boundary condition

Bookmark File PDF Surface Impedance Boundary

(1.2.31) $Z = 0$ appears, e.g. for complex amplitude pressure in acoustics, when the surface material has a very low acoustic impedance compared to the acoustic impedance of the carrier medium ($Z_2 \ll Z_1$). In this case the surface is called sound soft.

Summary. It is shown how the exact electromagnetic boundary conditions at the surface of a material of large refractive index can be approximated to yield the usual impedance or Leontovich boundary conditions. These conditions relate the tangential components of the electric and magnetic fields (or the normal components

Surface Impedance Boundary Conditions: A Comprehensive ...

As originally formulated by Russian physicist Mikhail Leontovich, the boundary condition is given as. $\mathbf{E}_t = \zeta_s \mathbf{H}_t \times \mathbf{n}^{\wedge}$, $\{\displaystyle \mathbf{E}_t\} = \zeta_s \mathbf{H}_t \times \hat{n}$

Bookmark File PDF Surface Impedance Boundary

$\{n\}$ }, where \mathbf{E}_t and \mathbf{H}_t are the tangential components of the electric and magnetic fields, respectively, and \mathbf{E}_n is the normal component of the electric field.
