In physics, the principle of relativity is the requirement that the equations describing the laws of physics have the same form in all admissible frames of reference. For example, in the framework of special relativity the Maxwell equations have the same form in all inertial frames of reference. In the framework of general relativity the Maxwell equations or the Einstein field equations have the same form in arbitrary frames of reference. Several principles of relativity have been successfully a

The principle of relativity holds that the laws of physics will function the same way in similar conditions, regardless of an observer ' s location or speed. The principle of relativity should not be confused with the theories of general or special relativity, although those theories use the principle as their basis.

Following up on his two previous works, *The Principles of Natural Knowledge* and *The Concept of Nature*, Whitehead explains his alternative theory of relativity, which "cuts away the casual heterogeneity" of Einstein's later theory. Dividing his book into three parts--General Principles, Physical Applications, and Elementary Theory of Tensors--the author's arguments and observations utilize his own unique mix of nature, philosophy, and "the old division between physics and geometry."

Originally published in 1922, this book forms the follow-up volume to "The Principles of Natural Knowledge" (1919) and "The Concept of Nature" (1920). In it, Whitehead puts forward an alternative theory of relativity, one which goes against the heterogeneity of Einstein's later theories in deducing that 'our experience requires and ...

The key to understanding special relativity is Einstein's relativity principle, which states that: All inertial frames are totally equivalent for the performance of all physical experiments. In other words, it is impossible to perform a physical experiment which differentiates in any fundamental sense between different inertial frames.

General relativity is a theory of gravitation developed by Einstein in the years 1907 – 1915. The development of general relativity began with the equivalence principle, under which the states of accelerated motion and being at rest in a gravitational field (for example, when standing on the surface of the Earth) are physically identical. The upshot of this is that free fall is inertial motion ...
