Figure 5.7.3. Two-dimensional simplification of one hand holding an object versus two hands holding the same object. Strategies to Solve Three-dimensional Equilibrium Problems. While three-dimensional systems are closer to reality than their two-dimensional cousins, they do require a bit more math to solve. The two reasons more math is required is:

The first step in solving 3D equilibrium problems is to draw a free-body diagram of the body: Support Reactions should be studied SUPPORT REACTIONS IN 3-D (Table 5-2) As a general rule, if a support prevents translation of a body in a given direction, then a reaction force acting in the opposite direction is developed on the body.

The first equilibrium condition for the static equilibrium of a rigid body expresses translational equilibrium: ?k ?F k = ?0. ? k F ? k = 0 ?. The first equilibrium condition, (Figure), is the equilibrium condition for forces, which we encountered when studying applications of Newton's laws.

The gömböc (Hungarian: [??ømbøt?s]) is a convex three-dimensional homogeneous body that when resting on a flat surface has just one stable and one unstable point of equilibrium. Its existence was conjectured by the Russian mathematician Vladimir Arnold in 1995 and proven in 2006 by the Hungarian scientists Gábor Domokos and Péter Várkonyi. The gömböc shape is not unique; it has countless varieties, most of which are very close to a sphere and all with a very strict shape ...

If an object is at rest and is in a state of equilibrium, then we would say that the object is at "static equilibrium." "Static" means stationary or at rest. A common physics lab is to hang an object by two or more strings and to measure the forces that are exerted at angles upon the object to support its weight. The state of the object is analyzed in terms of the forces acting upon the object. The object is a point on a string upon which three forces were acting. See diagram at right.

THE EQUATIONS OF 3-D EQUILIBRIUM When a particle is in equilibrium, the vector sum of all the forces acting on it must be zero (?F= 0) . This equation can be written in terms of its x, y and z components. This form is written as follows. (?F x) i + (?F y) j + (?F z) k= 0 This vector equation will be satisfied only when ?F x = 0 ?F y = 0

For static equilibrium of the isolated particle, the resultant of the two forces – Wacting downward and Racting upward – must be zero. RW– = 0 This leads to the not very earth shaking conclusion that the magnitude of the reaction force, acting up, must equal the weight.
