Trophic cascades, reciprocal predator – prey effects that alter changes of nonadjacent trophic level, are mostly demonstrated for aboveground ecosystems (Schmitz 2008, Carpenter et al. 2010, Schmitz et al. 2010). In contrast, the role of trophic cascade effects in detrital food webs has been less explored.

Trophic cascades are indirect ecological interactions, events in nature that move through multiple trophic levels (remember the food chain or pyramid: vegetation – herbivores – predators, as a simple example); that makes these cascades the ecological equivalent of the well-known ‘ trickle down ’ effect in economics.
